NO-CODE CLASS PROJECT · N8N

Clip Desk

Turn a long YouTube video into short clips, without opening an editor.

Today Search YouTube by hand, then cut every clip by hand.

Clip Desk Describe the video you want. The clips arrive by email.

THE PIPELINE

How it works

01
Ask
Web page, Telegram or n8n form. In Telegram, Gemini AI reads your message.

02
Find
The YouTube Data API searches, then the best video is picked.

03
Clip
Vizard AI cuts it into short, captioned clips.

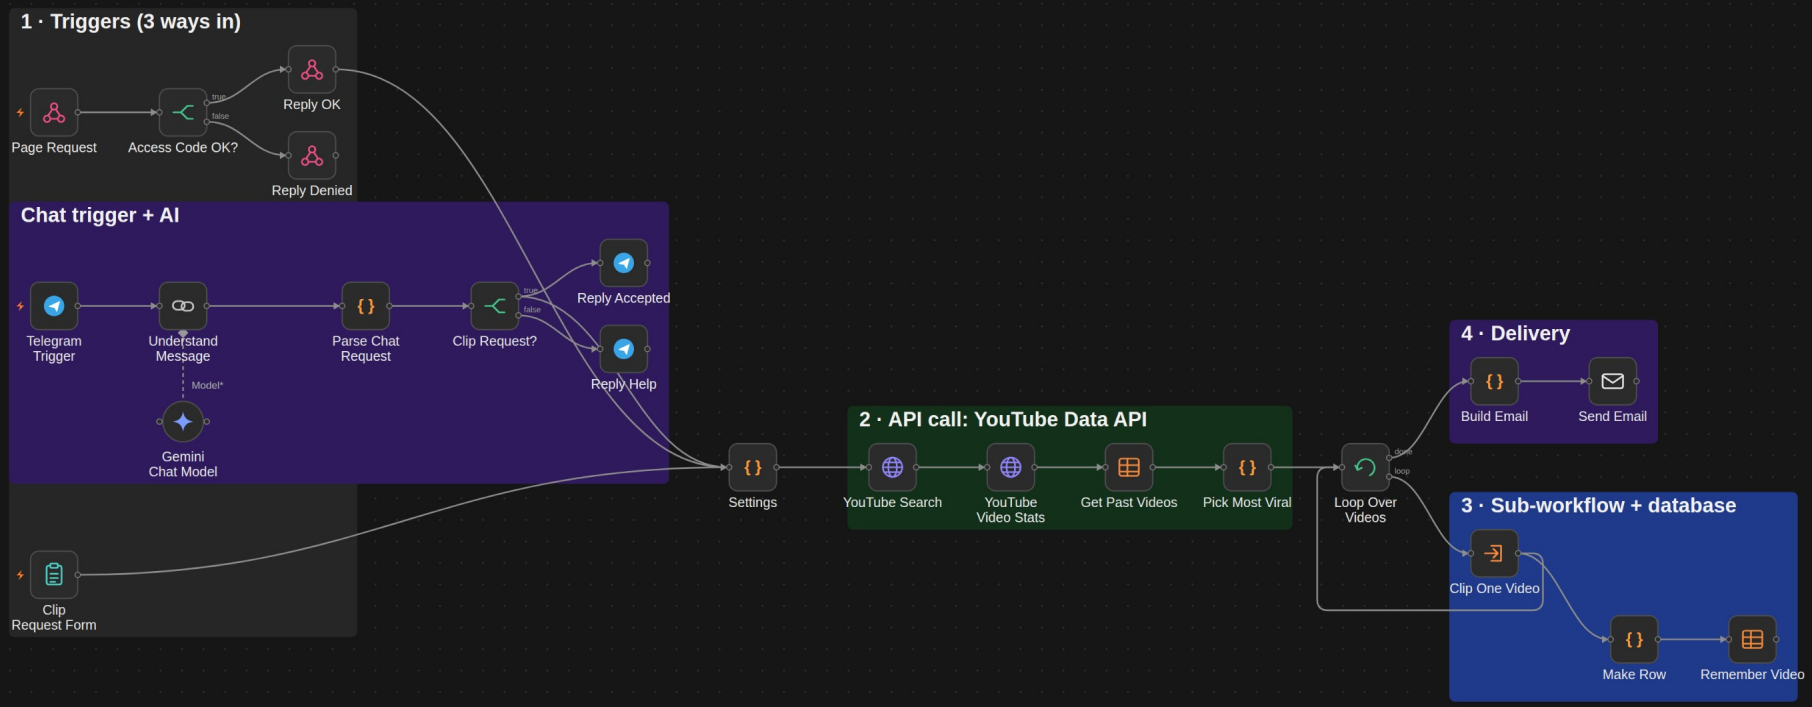

04
Remember
A data table stores every video, so none is clipped twice.

05
Deliver
Gmail sends the clip links. No clips, no email.

What the class asked for, all in this project

- ✓ If node (router)
- ✓ Code node
- ✓ API: YouTube, Vizard
- ✓ Telegram trigger
- ✓ Database: Data Table
- ✓ AI node: Gemini
- ✓ Sub-workflow
- ✓ Errors + retries

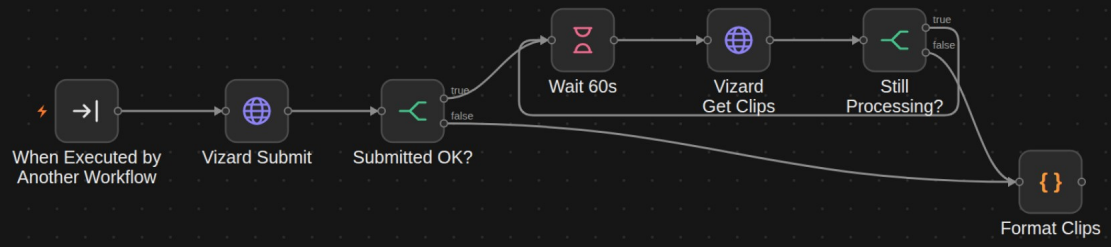

1 · Clip Desk (main workflow)

Three automations, one pipeline

Everything from the request to the email runs in the main workflow.

2 · Clip One Video (sub-workflow)

3 · Error Alert

The main workflow calls Clip One Video once per video. If a run fails, Error Alert emails me.
